

Summary of Exploratory Data Analysis

- The dataset contains 13 variables, including the target variable (price) and 12 predictor variables.
- Correlation analysis identified the variables most strongly associated with house prices.
- Larger house areas generally correspond to higher selling prices.
- Houses with more bedrooms, bathrooms, stories, and parking spaces tend to command higher prices.
- Houses located in preferred areas and those with air conditioning generally have higher market values.
- The dataset is clean and suitable for predictive modelling.
- These findings provide a strong foundation for developing regression and classification models in the next stage of the project.
